

CLAIMS

What is claimed is:

1 1. A tunable quantum well infrared photodetector focal plane array (QWIP
2 FPA) imaging device, comprising:

3 one or more detector layers including asymmetric quantum wells, each detector
4 layer between contact layers, thereby defining a stack of layers having a
5 front side and a back side, wherein each detector layer has a spectrum of
6 light absorption that changes in response to an applied bias;

7 a light-coupling grating formed on the backside of the stack, the grating having a
8 pattern that reflects a substantial portion of incoming light so as to disperse
9 that light through the one or more of the detector layers, thereby facilitating
10 absorption; and

11 a reflective coating on sides of the detector layers so as to provide, in conjunction
12 with the light-coupling grating, a photon-in-a-box configuration for
13 containing light.

1 2. The device of claim 1 wherein each detector layer is not more than about
2 one micron in thickness.

1 3. The device of claim 1 further comprising a read-out integrated circuit
2 (ROIC) that includes biasing circuitry adapted to deliver bias signals to each detector layer
3 thereby enabling tunability of the corresponding spectrum of light absorption.

1 4. The device of claim 3 wherein each contact layer of the device is electrically
2 coupled to a backside contact, thereby facilitating connection to the ROIC.

1 5. The device of claim 3 wherein the ROIC further includes an image processor
2 adapted to receive pixel data from each detector layer and to generate corresponding
3 images associated with the pixel data.

1 6. The device of claim 1 wherein the stack of layers is one multicolor pixel of
2 the device, and is repeated a number of times thereby defining an array of the multicolor
3 pixels.

1 7. The device of claim 1 wherein each asymmetric quantum well is a unit cell
2 comprising two quantum wells coupled by a barrier, where one of the quantum wells is
3 configured to absorb a first spectrum, and the other quantum well is configured to absorb a
4 second spectrum.

1 8. The device of claim 7 wherein the quantum well configured to absorb the
2 second spectrum includes a well spike.

1 9. The device of claim 7 wherein applying a first bias causes the first spectrum
2 to be dominant and applying a second bias causes the second spectrum to be dominant.

1 10. The device of claim 1 wherein applying a first bias causes a first spectrum of
2 absorption to be dominant and applying a second bias causes a second spectrum of
3 absorption to be dominant.

1 11. A tunable quantum well infrared photodetector focal plane array (QWIP
2 FPA) imaging device, comprising:

3 one or more detector layers each including a plurality of asymmetric unit cells, each
4 detector layer between contact layers, thereby defining a stack of layers
5 having a front side and a back side;

6 wherein each unit cell includes two quantum wells coupled by a barrier, and one of
7 the quantum wells is configured to absorb a first spectrum in response to a
8 first bias being applied, and the other quantum well includes a well spike
9 and is configured to absorb a second spectrum in response to a second bias
10 being applied.

1 12. The device of claim 11 further comprising a read-out integrated circuit
2 (ROIC) that includes biasing circuitry adapted to deliver the first and second bias signals to
3 each detector layer thereby enabling spectral tunability of the device.

1 13. The device of claim 12 wherein each contact layer of the device is
2 electrically coupled to a backside contact, thereby facilitating connection to the ROIC.

1 14. The device of claim 12 wherein the ROIC further includes an image
2 processor adapted to receive pixel data from each detector layer and to generate
3 corresponding images associated with the pixel data.

1 15. The device of claim 11 wherein the stack of layers is one multicolor pixel of
2 the device, and is repeated a number of times thereby defining an array of the multicolor
3 pixels.

1 16. A tunable quantum well infrared photodetector focal plane array (QWIP
2 FPA) imaging device, comprising:

3 one or more detector layers including asymmetric quantum wells, each detector
4 layer between contact layers, thereby defining a stack of layers having a
5 front side and a back side, wherein each detector layer has a spectrum of
6 light absorption that changes in response to an applied bias;

7 a read-out integrated circuit (ROIC) that includes biasing circuitry adapted to
8 deliver bias signals to each detector layer thereby enabling spectral
9 tunability; and

10 an image processor adapted to receive pixel data from each detector layer and to
11 generate corresponding images associated with the pixel data.

1 17. The device of claim 16 wherein the stack of layers is one multicolor pixel of
2 the device, and is repeated a number of times thereby defining an array of the multicolor
3 pixels, from each of which the image processor receives pixel data.

1 18. The device of claim 16 wherein each asymmetric quantum well is a unit cell
2 comprising two quantum wells coupled by a barrier, where one of the quantum wells is
3 configured to absorb a first spectrum, and the other quantum well includes a well spike and
4 is configured to absorb a second spectrum.

1 19. The device of claim 18 wherein applying a first bias causes the first
2 spectrum to be dominant and applying a second bias causes the second spectrum to be
3 dominant.

1 20. The device of claim 16 wherein applying a first bias causes a first spectrum
2 of absorption to be dominant and applying a second bias causes the second spectrum of
3 absorption to be dominant.
